

Global Employment Outlook

Global spill-overs from advanced to emerging economies worsen the situation for young jobseekers

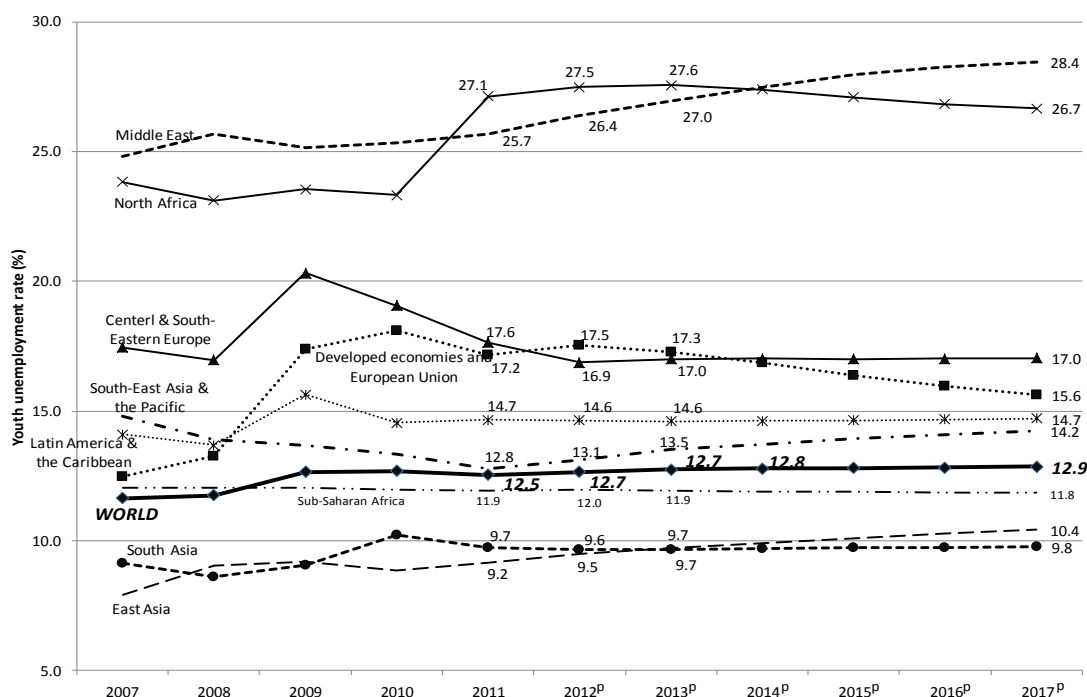

Young unemployed people around the world may not see their situation improve soon. As the euro area crisis continues in its second year, the impacts are spreading further, slowing down economies from East Asia to Latin America. Other regions such as Sub-Saharan Africa that had expected faster improvements in their youth labour markets will now take longer to revert to levels seen prior to the global financial crisis. In developed economies, youth unemployment rates are expected to fall over the

coming years, after having suffered from the largest increase among all regions at the beginning of the crisis, but principally because discouraged young people are withdrawing from the labour market and not because of stronger hiring activity among youngsters. Despite this decline and even though the young unemployed in advanced economies represent 13% of the world total, the global youth unemployment rate is expected to continue to edge higher beyond 2014 (chart 1 provides the ILO's

estimates and projections of global and regional unemployment rates from 2007 to 2017).

In certain regions, the regional youth unemployment rate disguises large variation across countries. In particular in the Developed Economies region, youth unemployment rates range from over 50% in Spain and Greece to less than 10% in Germany and Switzerland. Even when the youth unemployment ratio is considered – the number of young unemployed in

Chart 1: Global and regional youth unemployment rates (15-24 years)

Note: Youth unemployment rates for young job seekers between 15 and 24 years in per cent of active youth population. Estimate (e) for 2011; Projections (p) for 2012 through 2017.

the total youth population – numbers vary from over 20% in Spain to less than 5% in Germany (see box 1).

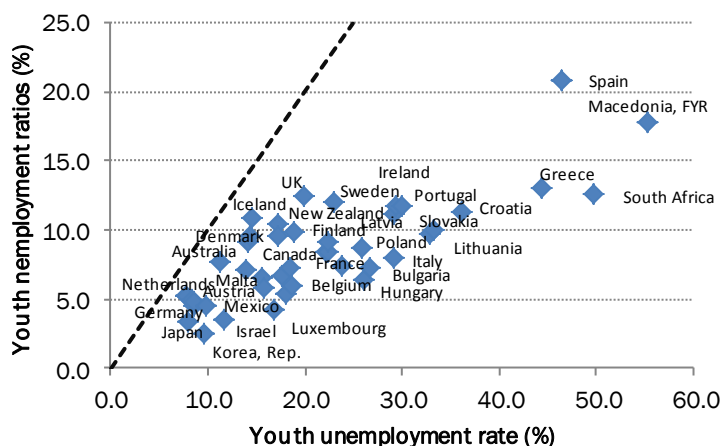

The deterioration in youth labour markets is also visible in other indicators. In the EU, part-time work among youth has grown faster than among adults, and increasingly appears to be driven by a lack of alternative employment opportunities for young people (see <http://www.ilo.org/global/research/global-reports/global-employment-trends/youth/2012/lang-en/index.htm>). Also, a recent analysis estimates the share of young European workers in the informal economy at about 17 per cent, compared to 7 per cent for prime age workers. On the other hand, the bleak situation for young jobseekers has triggered only limited cross-border movements of young people but a lengthy and stretched-out recovery is likely to intensify the quest of young, more mobile people to seek their fortunes abroad.

The difficulties of young people to find gainful employment reflects the overall weak state of labour markets around the world (see table 1). Global output has grown weakly over the past six months and is not expected to accelerate in the near future. As noted in the WTO's World Trade Report 2012, global trade has also decelerated sharply as global demand especially in advanced economies has faltered. This has created global spillovers, leading to a slow-down of activity in emerging economies in East and South Asia and Latin America. High private and public debt in the advanced economies is leading to private households and firms deleveraging to relieve their high debt burden through increased savings rates, and austerity measures for public sectors. The combined downward pressure on both private and public consumption and investment is dragging down aggregate demand and growth. Therefore, at the current juncture there is a substantial risk that this simultaneity may trigger yet another significant downward spiral

Box 1: Youth unemployment rates vs. ratios in international comparison

Cross-country comparisons of the extent of youth unemployment are complicated by the fact that large differences exist across countries regarding the labour market participation of people below the age of 25. Partly, this is related to differences in the education system as countries with a well-developed vocational training system consider young people to be employed while they are following their (part-time) vocational education. In contrast, in countries with full-time education systems only those who have completed a first secondary degree or have dropped out of school and are seeking work are typically considered to be part of the labour force. Such effects of institutional differences across countries on measured youth unemployment can be addressed by considering the youth unemployment ratio rather than the rate. As chart 2 shows, this results in lower values for the youth unemployment ratio because of a larger denominator (the youth population rather than the youth labour force) compared to the youth unemployment rate. Youth unemployment ratios, therefore, have a tendency to underestimate the extent to which joblessness prevails among young people, in particular when youth labour force participation is low and youth unemployment rates are high as illustrated by the fact that countries lie further away from the dotted, 45 degrees line in chart 2, the higher their youth unemployment rate and the lower their youth labour force participation rate is.

Chart 2: Unemployment rates vs. unemployment ratios in selected countries

Note: The chart shows the relationship between the youth unemployment rates and youth unemployment ratios for selected countries. The dotted line represents the 45 degrees line.

In addition, cross-country comparisons of youth joblessness are further complicated by the fact that youth unemployment rates tend to understate the problem of young people on the labour market in many developing and emerging economies. In these countries, labour force participation rates are typically higher among young people than in developed economies. As alternative income opportunities or well-developed social protection systems rarely exist in these countries, young people are eager to take up any form of employment, be it in the informal economy or below their education level. This tends to suggest a youth employment situation that is better than what is actually experienced by those in the labour market who have to face low, unstable incomes and weak prospects.

that could bring the world economy closer to another global recession by the end of 2012, further threatening a sustained labour market recovery.

Additional downward pressure on the global economy is coming from

a worsening of the credit crunch that stems from unresolved sovereign debt problems in Europe. The bust of the earlier housing boom in several advanced economies together with a general need for deleveraging in the private sector left banks with

Table 1: Global and regional total unemployment rates (age 15 and above)

Region	2011 ^e	2012 ^p	2013 ^p	2014 ^p	2015 ^p	2016 ^p	2017 ^p

unsustainable levels of non-performing loans, forcing some governments to bail out their distressed banks. This transferred private debt into public. The ensuing increase in interest payments and a general distrust in the capacity of the public sector to successfully manage this enhanced debt burden has compelled these governments into several rounds of austerity to reduce their borrowing costs. As a result, and despite highly accommodative monetary policy, the combination of skyrocketing risk premia for long-term loans and depressed aggregate demand due to fiscal austerity measures have prevented both the private and the public sector in these countries from recovering and creating new jobs.

Moreover, structural imbalances that were built up prior to the crisis have worsened, further slowing the recovery. Indeed, even in countries with first signs of a jobs recovery and where firms started to open new vacancies, many unemployed have had difficulties in landing a job. This is partly linked to the shift in sectoral demand that countries with a bust housing sector face: As employment in sectors such as construction declines new sectors with different skill requirements may not be able to absorb the unemployed from these shrinking sectors. In some countries with high youth unemployment rates, this is a particularly harsh problem leading to discouragement and rising NEET rates ("neither in employment, education or training") among young people.

Looking ahead, a pre-condition for improvement in youth unemployment is a return to a sustained growth path and a general strengthening of the labour market. Without additional jobs being created, young people cannot expect to find employment. However, given the sheer size of the problem, even a quick acceleration in growth may not provide sufficient job opportunities in a short period of time. To address this, the ILO is calling for targeted measures to improve the labour market situation, especially for youth (see http://www.ilo.org/wcmsp5/groups/public/-ed_emp/documents/publication/wcms_151459.pdf). For example, providing employment or training guarantees for (targeted groups of) young people – such as those that

currently exist in several countries – could help get young job-seekers off the street and into useful activities and act as a safeguard against further economic and social stress. Estimates show that such programmes can come at very limited costs, less than half a per cent of GDP among European countries (see table 2), depending on administrative costs and actual take-up.

This is consistent with costs observed in existing youth employment guarantee programmes, such as those enacted in Austria, Denmark, Finland, Norway and Sweden. In Sweden, a job guarantee programme for youth enacted in the 1980s and reformed in 2007 combined active labour market

policies (such as intensive job matching efforts and further skills development) with payroll tax cuts for employers hiring young people. This programme was estimated to cost less than 0.1% of GDP in 2008. Broader employment guarantee programmes targeting persons of all ages living in poor households have also been enacted in some countries, most notably India. The cost of India's National Rural Employment Guarantee programme has been estimated at around 1% of GDP. In times of constrained public finances, this may seem like a large additional burden but it will be less than the additional costs that come from young unemployed people permanently losing touch with the labour market.
